important in classification. It also describes how DNA and RNA can help scientists determine evolutionary relationships.

Introduction (page 451) 1. What traits did Linnaeus consider when classifying organisms? He tried to group

## **Section 18-2 Modern Evolutionary Classification**

Evolutionary classification places organisms into higher taxa whose members are more closely related to one another than they are to members of any other group. The larger the taxon, the further back in time all of its members shared a common ancestor. In this system, organisms are placed into groups called clades.

### **Section 18-2 Modern Evolutionary Classification | pdf Book ...**

Modern evolutionary classification uses a method called cladistic analysis to determine how clades are related to one another. This information is used to link clades together into a cladogram, which illustrates how groups of organisms are related to one another by showing how evolutionary lines, or lineages, branched off from common ancestors.
