instructions to be executed in a certain order to get the desired output.

Algorithms are generally created independent of underlying languages, i.e. an algorithm can be implemented in more than one programming language.

Data Structures and Algorithms are actually two separate things. However, they are frequently taught together as one course because they work hand-in-hand with each other. To best explain what data structures and algorithms are, let's first talk about each of them separately. Algorithms. It may sound like a difficult concept but the ...

Algorithms work together to solve computational problems, usually by enabling an algorithm to manipulate data efficiently. The algorithm uses a set of rules (the data) to find the greatest common divisor, with one example being YouTube tracking a user's activities to display videos relevant to them.
